

# RLG Commander

**Diese Seite ist auf deutsch verfügbar.**

The commander is the central control unit for the whole system. It tells the agents which signals to send, calculates the score, reacts to "button-pressed-events" etc. Different game modes can be loaded onto the commander. The agents change their role to match the needs of the loaded game. For instance: if we change the game from **Conquest** to **Rush**, the agents change their role from Capture Points to M-Coms.

The commander communicates with the agents via the **MQTT** protocol and can be controlled via a **REST** interface. There is also a **remote control** software (rlgrc) to connect to the commander.
